

## ***Save the Honey Bees in Plymouth Twp***

*Are Honey Bees pollinators and beneficial insects?  
Or insect pests to be eradicated, exterminated & destroyed?*

By: Charles Breinig [CharlieNoSpam-Beekeeper@yahoo.com](mailto:CharlieNoSpam-Beekeeper@yahoo.com)

Many local governments contemplate whether Honey Bees are pests or beneficial insects. Are all bees pests? What makes a bee a pest? Their stinger? What if they only use the stinger to defend their home, when it is being disturbed?

How are Honey Bees different from Wasps & Yellow Jackets? Can you or your friends tell the difference?

Does the fear and anxiety of bees translate into a reasonable expectation of danger from honey bees? How many problems has the township experienced to date from local Honey Bees?

If we outlaw Honey Bees, what is the impact on local flower gardens, home grown vegetable gardens, and fruit trees?

**Fortunately for homeowners with vegetable gardeners, flower gardeners, and people concerned about the environment, reason and science usually outweighed fear and anxiety.**

Even myself, before I was educated to the plight of Honey Bees (four years ago), I was scared of bees. As a kid I cut lawns, and was stung by yellow jackets on numerous occasions. I did not understand the difference between Honey Bees, Yellow Jackets and Wasps. Now that I have seen Honey Bees and handled them, I find them sweet, gentle, stinging only when you disturb their hive or crush them. They are not like yellow jackets or wasps, which will sting you multiple times. **When a Honey Bee stings, they die. So they are genetically predisposed to only sting as a matter of last resort.**

Although a yellow jacket may be a pest, her cousin the Honey Bee is not. My wife and I often spend time in the summer taking the roof off our hives and watching our Honey Bees (in T-shirts and shorts, without veils), because they are so fascinating. We have 3-6 hives, and generally lose 50-60% of our hives over the winter. We split the hives in the summer, so we can have at least two hives for the spring pollination of our garden and our neighbor's apple tree, and the nectar flow. Since the Queen starts laying eggs in early January, we need 2-3 strong hives in March when they start foraging for pollen and nectar.

I can't imagine that there is anyone, who has not heard the alarms surrounding the disappearance of Honey Bees. School children are urging their parents to "help the honey bees" <http://www.helpthehoneybees.com/> They are not only critical to our nation's agriculture, they are critical to local gardens as well. There are many supporters of the Honey Bees including local gardening clubs, and environmental groups. This is because most people understand that Honey Bees are beneficial insects and not pests. **Otherwise, who would care?**

Honey Bees differ from Yellow Jackets and Wasps, just as a Seeing-Eye Dog differs from a Wolf. Same species, but entirely different in temperament, and benefit to society.

### **Who else thinks Honey Bees are beneficial insects?**

There are Honey Bees on roof tops in Paris, in the city of Philadelphia, in small boroughs like Jenkintown and Ambler. Even the White House has Honey Bee hives. New York City overturned its ban on beekeeping, because of their increased awareness of the importance of Honey Bees <http://cityroom.blogs.nytimes.com/2010/03/16/bring-on-the-bees/>

The State of PA (and the U.S. Government) consider Honey Bees to be beneficial insects, critical to our state's and nation's agriculture. Hundreds of thousands of dollars are being spent in Pennsylvania (Penn State) and at other Universities, researching the causes of CCD (Colony Collapse Disorder). These funds are earmarked to help the Honey Bee because it is such a beneficial insect.

There are **no** experts that consider the Honey Bee to be a pest to be eradicated.

Honey Bees are beneficial and critical to local community gardens and fruit trees. Local Garden clubs, realize that without the Honey Bee, many flowers will not be pollinated, and the diversity of our flowers, and vegetables would diminish. My neighbor, who was initially concerned about my hives, now recounts what a wonderful bounty his apple tree produces, now that I have hives. Honey Bees are not just beneficial, they are critical to local vegetable gardens, fruit trees, and flowers. However, many members of the public are not aware how important they are, plus they are fearful of being stung. If only we could educate them as to how un-dangerous Honey Bees are!

Four years ago, I too was unaware and fearful of Honey Bees. But now that I understand that I will not be stung unless I crush them or disturb their hive, I have learned to love and appreciate them. I also know that if I use a smoker, I can even disturb their hives and not get stung. I often do so without a veil or any protective clothing (in a T-shirt and shorts). Now that I have had Honey Bees land on my arm, and watched them lick salt from my arm, I am not fearful. I have even had a local cub-scout troop come to look at my hives. The kids were fascinated and not fearful.

Parents want to protect their kids. We understand that. If parents could see pictures of a beekeeper and their kids, at their hive, pulling a frame in their normal summer garb, then they will understand how docile Honey Bees are. If they could see pictures of hives on small lots in local boroughs and in cities, where the lots are 25' wide, they would understand that you don't need to have 1 acre lots. As we know, bees will leave the hive, flying out 10' and then zoom up to the tree line, flying up to 2-3 miles to get nectar and pollen. So neighbors should have little fear of the honey bees congregating in their yard.

Maintaining a healthy diverse population of Honey Bees in our neighborhoods is important not only for their survival, but also for their genetic diversity as a species. There are many more Beekeepers in our communities, than the public knows about, because beekeepers understand the unfounded fear and reaction that many people have concerning bees. Thus hives are in inconspicuous places.

### **Interesting facts:**

1. Did you know that Honey Bees are strict vegetarians, eating only plant products (pollen and nectar), and never land on meat.
2. Did you know that Yellow Jackets are carnivorous wasps, and are a nuisance at picnics where they gather meat?
3. Did you know that 15% to 30% of the Honey Bees you see flying are collecting pollen, (varying from 50-300 flowers per load, and making 1-50 trips a day to do so)?
4. Did you know that the other flying Honey Bees are collecting nectar (100-1500 flowers per load), and making 1-29 trips per day?
5. Their Trips last from 5-15 minutes.

That is a lot of pollination!

**To conclude:** Honey Bees are beneficial to local community gardens and fruit trees, and pose little risk to the health, safety and welfare of the public. They are not aggressive like other bees and are not a pest. Honey Bees are kept in managed hives and are not a random unwanted infestation. There are constant news articles about the national threat to our food supply, due to Bee colony losses. But having local beekeepers is just as important to local flower gardeners and vegetable gardeners, as having water and compost. Local Beekeepers are an insurance policy against devastating losses by large commercial growers, and provide unique opportunities to maintain and ensure genetic diversity. The public is not aware of how many local beekeepers there are in their neighborhoods, because Beekeepers are good at shielding the hives from public view. Any time I see a Honeybee, I know there is a beekeeper near by. There are many residents whose first reaction on learning of a neighboring beehive is fear. Outlawing Beekeeping because of that unfounded fear, would negatively impact the health and enjoyment of other residents who are gardeners and have wonderful organic vegetable garden, great wildflower gardens, and chemical-free fruit trees that yield bountiful harvests. Also, impacting consumers seeking out local honey because it is healthier than store bought. Preserving local Beekeeping is vital! Let's uphold this valuable avocation!

1. **Do you have Nature Deficit Disorder (NDD)?**  
Dennis vanEngelsdorp (the Acting State Apiarist for the PA Department of Agriculture) thinks that we might.... and that it may be contributing to CCD.... "Make Meadows Not Lawns" is one of his quotes, and it would make a great bumper sticker. He remarks that 11% of all pesticide use in the US goes to maintaining our lawns, which are sterile fields as far as the bees are concerned -- no pollen sources in evidence!

*At a recent presentation by the Montgomery County Beekeepers Association, Joel Eckels shared photos of his brother and himself working their hives in Philadelphia without veils, with their faces right up against the frames watching the bees. Obviously the pictures showed that beekeepers have no reason to be afraid of the Honey Bees, even when they are disturbing the hives and removing frames of Honey Bees for inspection. Joel also testified that Philadelphia is a much more densely populated area, and has many hives in much closer proximity to neighbors. Pictures from a home on a 50' wide lot in Jenkintown Borough (with 3 hives) was also shown, as additional evidence of safe Beekeeping on small lots.*

*Jim Bobb, a Montgomery County Beekeeper, and Chairman of EAS (Eastern Apicultural Society) testified on the temperament of Bees and having permanent observation hives in very public areas like Longwood Gardens (The Longwood Garden Treehouse, is a favorite for families; the beehive entrance directs bees away from the tree, but they fly all over the area). A beehive in such a public place demonstrates that they are not dangerous.*

*Anne Javscas, head of a local School told about having hives on the school grounds, and the problems they faced with stings from yellow jackets, which were attracted to kids eating lunch outside; yet not one sting from a Honey Bee. Asked how she knew if the stings were from yellow jackets and not Honey Bees, she explained that Honey Bees sting only once and leave the stinger in the skin. Jim pointed out that Honey Bees are vegetarians and are not attracted to the student lunches.*

**If you are a homeowner with a vegetable garden, flower garden, or enjoy fresh local fruits and vegetables, don't let fear and anxiety outweigh reason and science!**
